Site visit inspection report on compliance with HTA licensing standards

University Hospital Lewisham

HTA licensing number 12266

Licensed under the Human Tissue Act 2004 for the

- making of a post mortem examination;
- removal from the body of a deceased person (otherwise than in the course of an anatomical examination or post-mortem examination) of relevant material of which the body consists or which it contains, for use for a scheduled purpose other than transplantation; and
- storage of the body of a deceased person or relevant material which has come from a human body for use for a scheduled purpose

5 and 6 December 2017

Summary of inspection findings

The HTA found the Designated Individual (DI), the Licence Holder (LH), the premises and the practices to be suitable in accordance with the requirements of the legislation.

Although the HTA found that University Hospital Lewisham had met the majority of the HTA’s standards, three major and four minor shortfalls were found against standards relating to consent training, governance and quality systems and premises, facilities and equipment.

Particular examples of strengths and good practice are included in the concluding comments section of the report.
The HTA’s regulatory requirements

Prior to the grant of a licence, the HTA must assure itself that the Designated Individual is a suitable person to supervise the activity authorised by the licence and that the premises are suitable for the activity.

The statutory duties of the Designated Individual are set down in Section 18 of the Human Tissue Act 2004. They are to secure that:

- the other persons to whom the licence applies are suitable persons to participate in the carrying-on of the licensed activity;
- suitable practices are used in the course of carrying on that activity; and
- the conditions of the licence are complied with.

Its programme of site visit inspections to assess compliance with HTA licensing standards is one of the assurance mechanisms used by the HTA.

The HTA developed its licensing standards with input from its stakeholders. They are designed to ensure the safe and ethical use of human tissue and the dignified and respectful treatment of the deceased. They are grouped under four headings:

- consent
- governance and quality systems
- traceability
- premises facilities and equipment.

This is an exception-based report: only those standards that have been assessed as not met are included. Where the HTA determines that there has been a shortfall against a standard, the level of the shortfall is classified as ‘Critical’, ‘Major’ or ‘Minor’ (see Appendix 2: Classification of the level of shortfall). Where HTA standards are fully met, but the HTA has identified an area of practice that could be further improved, advice is provided.

HTA inspection reports are published on the HTA’s website.
Background to the establishment

University Hospital Lewisham (the establishment) has been licensed by the HTA since August 2007 for: the making of a post mortem (PM) examination; removal of relevant material from the deceased, and; storage of bodies of the deceased and relevant material for use for scheduled purposes. The Corporate Licence Holder is Lewisham and Greenwich NHS Trust and the Corporate Licence Holder contact (CLHc) is the Deputy Director of Governance and Patient Experience. The DI is the cellular pathology and mortuary manager. The hub site is University Hospital Lewisham (UHL) and the satellite site is Queen Elizabeth Hospital (QEH).

University Hospital Lewisham (the hub site)

The body storage area has 52 standard spaces, including 15 bariatric spaces, four super bariatric spaces, five bariatric freezer spaces and spaces for paediatric/perinatal cases pending transfer to QEH. There is a temporary storage unit, which is owned by the Trust, in the PM room, which can be used in busier periods. All fridges and freezers are temperature controlled and alarmed (see Advice, item 8).

A very small number of consented, adult hospital PM examinations take place, with one case in the last two years (see shortfall against C2(a)). The establishment does not conduct any high risk, Home Office or paediatric/perinatal cases at the hub premises. Coroner’s cases are transferred to another HTA-licensed establishment. The PM suite consists of three porcelain PM tables. If tissue is taken during PM, it is sent to the Pathology Laboratory within the hospital. The UHL site is currently staffed by two permanent Anatomical Pathology Technologists (APTs).

Queen Elizabeth Hospital (the satellite site)

QEH became a satellite of UHL in November 2013 when QEH became part of Lewisham and Greenwich NHS Trust. QEH carries out approximately 150 consented perinatal/paediatric PM examinations each year, along with a small number of consented adult PM cases. The establishment does not conduct any high risk or Home Office cases at the satellite premises. Coroner’s cases are transferred to another HTA-licensed establishment. The PM suite has two aspirated tables and associated dissection areas.
Tissue taken for histology is placed into cassettes in the mortuary and recorded in the specimen transit log.

The body storage area has 35 standard fridge spaces including four bariatric spaces and a separate paediatric/perinatal fridge. There are an additional 12 spaces of temporary storage in the PM room and the mortuary has a contract with Co-op Funeral Directors as a contingency plan. However, there are no facilities for long-term storage and bodies are often in fridges for longer than 30 days (see shortfall against PFE2(c)). Both storage areas are temperature controlled and alarmed (see Advice, item 8). QEH mortuary is staffed by one permanent APT.

Description of inspection activities undertaken

This report describes the third routine site visit inspection of the establishment. Previous inspections took place in April 2010 and March 2014. The inspection team interviewed staff involved with licensed activities including the DI, a cellular pathology consultant (who is also a Person Designated), two APTs and a bereavement midwife. A thorough document review was conducted and a visual inspection included the mortuary and body storage areas, the PM suite, separate storage areas and histology storage areas on both sites. The labour ward was visited at QEH.

A traceability audit was conducted on four bodies in QEH (two paediatric and two adult) and three bodies in UHL (one paediatric, two adult). Storage locations and identifiers recorded on the fridges, in paperwork and mortuary records were cross checked against the details on the bodies. The storage location recorded in the paper and electronic mortuary records had no discrepancies and full traceability was demonstrated. One of the bodies in QEH had the same name as another within the body store; however, no same/similar wristband was attached as required by the establishment’s procedures (see Advice, item 6). Vertical traceability audits were carried out on tissue removed during two PM examinations, including two paediatric hospital (consented) cases at QEH and two adult hospital (consented) cases at UHL. Paper records (consent forms and PM histology request forms), were compared to the number of blocks and slides stored in the histology department. There were no traceability discrepancies; however, one consent form had not been fully completed (see shortfall against C2(a)).
The Labour ward at QEH was visited to inspect the fridge used for the storage of products of conception (POCs), fetal remains, miscarriages and stillbirths prior to transfer to the mortuary. Despite the room containing the storage fridge being locked, the fridge itself is unlocked and does not alarm in the event of the temperature deviating from the expected range, which presents a risk to the dignity of the deceased (see shortfall against PFE2(e)).

Consent for paediatric/perinatal hospital PM examinations is sought by clinical staff using the consent form and information leaflet provided by the Stillbirth and Neonatal Death (Sands) charity, often supported by a bereavement midwife. Clinical staff receive training in seeking consent for PM examination as part of their clinical training and the training is offered annually and/or when demand arises. The cellular pathologist and/or the bereavement midwives are responsible for delivering this training, which includes competence assessment. However, there is no formal training for seeking consent for adult hospital PM examinations and this presents a significant risk that the wishes of the person giving consent may not be followed (see shortfall against C2(a)).
Inspection findings

The HTA found the Licence Holder, the Designated Individual and the premises to be suitable in accordance with the requirements of the legislation.

Compliance with HTA standards

Consent

| C2 Staff involved in seeking consent receive training and support in the essential requirements of taking consent |
|---|---|---|
| a) There is training for those responsible for seeking consent for post-mortem examination and tissue retention, which addresses the requirements of the HT Act and the HTA’s codes of practice | There is no specific training in place or records of training for those involved in seeking consent for adult PM examination. Therefore there is no assurance that suitably trained individuals are involved in seeking consent. | Major |

| GQ1 All aspects of the establishment’s work are governed by documented policies and procedures |
|---|---|---|
| a) Documented policies and SOPs cover all mortuary/laboratory procedures relevant to the licensed activity, take account of relevant Health and Safety legislation and guidance and, where applicable, reflect guidance from RCPath. | Whilst the central governance on both sites includes policies and procedures, there is a large variation in the documentation between both sites and this can be problematic for new staff and also when establishment staff work across both sites (see Advice, item 2). Several key SOPs and policies governing mortuary activities are lacking in detail and do not accurately reflect current practices. Examples of where SOPs do not contain the required detail include but are not limited to the establishment’s SOPs relating to receipt, release and viewing of the deceased. The SOPs do not describe that three separate identifiers are used to verify the identity of bodies when undertaking these procedures. | Minor |
### GQ2 There is a documented system of audit

| b) Audit findings document who is responsible for follow-up actions and the timeframe for completing these | Audit reporting is not consistent and does not contain sufficient detail related to audit findings. Additionally, recent audits have been conducted against the HTA’s previous compliance standards (*see Advice, Item 3*). | Minor |

### GQ5 There are systems to ensure that all untoward incidents are investigated promptly

| a) Staff know how to identify and report incidents, including those that must be reported to the HTA | Porters interviewed during inspection were not able to demonstrate sufficient knowledge and understanding of the Human Tissue Authority Reportable Incident (HTARI) procedure. Porter training does not extend to HTARI training meaning that porters are not fully aware of the requirement to report incidents to the HTA, the types of incident to report, the process that should be followed, who should report them and the timeframe that they should be reported in. | Minor |

### PFE1 The premises are secure and well maintained and safeguard the dignity of the deceased and the integrity of human tissue.

| a) The premises are clean and well maintained | Despite there being only one PM case in UHL in the last two years, the floor of the PM suite at UHL is showing significant signs of wear and pitting of the surface. It is not sufficiently clean with some edges and corners of the floor appearing dirty and requiring attention. There are flooring cracks in several areas, meaning that these areas cannot be cleaned effectively. | Minor |
PFE2 There are appropriate facilities for the storage of bodies and human tissue.

c) Storage for long-term storage of bodies and bariatric bodies is sufficient to meet needs

<table>

Advice

The HTA advises the DI to consider the following to further improve practices:

<table>
<thead>
<tr>
<th>No.</th>
<th>Standard</th>
<th>Advice</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>C1(f)</td>
<td>A consent form audited during the HTA inspection did not contain details of who to contact if the family wished to withdraw consent, and the timeframe that was available for them to do so. The DI is reminded to always include these details within the consent form.</td>
</tr>
<tr>
<td>2.</td>
<td>GQ1(a)</td>
<td>The DI is advised to continue to standardise procedures and policies across the hub and satellite to ensure consistency.</td>
</tr>
<tr>
<td>3.</td>
<td>GQ2(b)</td>
<td>The DI is advised that audits now need to be conducted against the HTA’s current standards, that were brought into force in April 2017.</td>
</tr>
<tr>
<td>4.</td>
<td>GQ6(a)</td>
<td>There are risk assessments that cover procedures related to licensed activities across both sites. The DI is advised to extend the suite of risk assessments to cover all HTARI categories.</td>
</tr>
<tr>
<td>5.</td>
<td>T1(b)</td>
<td>The DI is advised to consider implementing a numbering system of the trays in each bay of both body stores and noting this number in the mortuary register as this may help to strengthen traceability.</td>
</tr>
</tbody>
</table>
There was a discrepancy in the same/similar name procedure as there was no identifying wristband on the deceased. The DI is advised to make sure every body with a same/similar name has an identifying wristband as per the establishment’s procedure.

Although the fridge on the Labour Ward is within a locked room, there are times when staff may be in this room for other purposes and the fridge itself is unlocked. The DI is advised to consider putting a lock on this fridge so that no unauthorised staff can open it.

The DI is advised to review temperature records across both sites for trends and to undertake regular challenges of the alarm system to assure himself that it continues to operate, and be responded to, as expected.

**Concluding comments**

The HTA considers the DI to be a suitable person to oversee the conduct of licensed activities and he is dedicated to making improvements and implementing the necessary changes. There is great care shown at both sites to the dignity of the deceased and both teams have strong communication with the DI.

There were areas of strength and good practice observed throughout the inspection:

- The hospital release form is detailed and helps to mitigate the risks of misidentification and occurrence of potential HTA reportable incidents;
- The establishment's PD at QEH conducts turnaround time (TAT) audits meaning that storage times are monitored. This has contributed to the development of a business case addressing the need for increased long-term storage capacity.

There are a number of areas of practice that require improvement, including three major shortfalls and four minor shortfalls.

The HTA requires the Designated Individual to submit a completed corrective and preventative action (CAPA) plan setting out how the shortfalls will be addressed, within 14 days of receipt of the final report (refer to Appendix 2 for recommended timeframes within which to complete actions). The HTA will then inform the establishment of the evidence required to demonstrate that the actions agreed in the plan have been completed.

The HTA has assessed the establishment as suitable to be licensed for the activities specified subject to corrective and preventative actions being implemented to meet the shortfalls identified during the inspection.

**Report sent to DI for factual accuracy: 08/01/2018**

**Report returned from DI: 17/01/2018**

**Final report issued: 02/02/2018**
Appendix 1: HTA licensing standards

The HTA standards applicable to this establishment are shown below; those not assessed during the inspection are shown in grey text. Standards that are not applicable have been excluded.

<table>
<thead>
<tr>
<th>Consent</th>
</tr>
</thead>
<tbody>
<tr>
<td>C1 Consent is obtained in accordance with the requirements of the Human Tissue Act 2004 (HT Act) and as set out in the HTA’s codes of practice</td>
</tr>
<tr>
<td>a) There is a documented policy which governs consent for post-mortem examination and the retention of tissue and which reflects the requirements of the HT Act and the HTA’s Codes of Practice.</td>
</tr>
<tr>
<td>b) There is a documented standard operating procedure (SOP) detailing the consent process.</td>
</tr>
<tr>
<td>Guidance</td>
</tr>
<tr>
<td>This should include who is able to seek consent, what training they should receive, and what information should be provided to those giving consent for post-mortem examination. It should make reference to the use of scanning as an alternative or adjunct to post-mortem examination.</td>
</tr>
<tr>
<td>c) There is written information for those giving consent, which reflects the requirements of the HT Act and the HTA’s codes of practice.</td>
</tr>
<tr>
<td>Guidance</td>
</tr>
<tr>
<td>Information on consent should be available in different languages and formats, or there is access to interpreters/translators. Family members should be given the opportunity to ask questions.</td>
</tr>
<tr>
<td>d) Information contains clear guidance on options for how tissue may be handled after the post-mortem examination (for example, repatriated with the body, returned to the family for burial/cremation, disposed of or stored for future use), and what steps will be taken if no decision is made by the relatives.</td>
</tr>
<tr>
<td>e) Where consent is sought for tissue to be retained for future use, information is provided about the potential uses to ensure that informed consent is obtained.</td>
</tr>
<tr>
<td>f) The deceased’s family are given an opportunity to change their minds and it is made clear who should be contacted in this event and the timeframe in which they are able to change their minds.</td>
</tr>
<tr>
<td>g) The establishment uses an agreed and ratified consent form to document that consent was given and the information provided.</td>
</tr>
<tr>
<td>Guidance</td>
</tr>
<tr>
<td>This may be based on the HTA’s model consent form for adult post-mortem examinations available on the HTA website, or in relation to infants, the resources pack developed by the</td>
</tr>
</tbody>
</table>
Stillbirth and neonatal death charity, Sands. The consent forms should record the consent given for the post-mortem examination and for the retention and future use of tissue samples.

**C2 Staff involved in seeking consent receive training and support in the essential requirements of taking consent**

a) There is training for those responsible for seeking consent for post-mortem examination and tissue retention, which addresses the requirements of the HT Act and the HTA’s codes of practice.

*Guidance*

*Refresher training should be available (for example annually).*

b) Records demonstrate up-to-date staff training.

c) If untrained staff are involved in seeking consent, they are always accompanied by a trained individual.

d) Competency is assessed and maintained.

**Governance and quality systems**

**GQ1 All aspects of the establishment’s work are governed by documented policies and procedures**

a) Documented policies and SOPs cover all mortuary/laboratory procedures relevant to the licensed activity, take account of relevant Health and Safety legislation and guidance and, where applicable, reflect guidance from RCPath. These include:

i. post-mortem examination, including the responsibilities of Anatomical Pathology Technologists (APTs) and Pathologists and the management of cases where there is increased risk;

ii. practices relating to the storage of bodies, including long term storage and when bodies should be moved into frozen storage;

iii. practices relating to evisceration and reconstruction of bodies;

iv. systems of traceability of bodies and tissue samples;

v. record keeping;

vi. receipt and release of bodies, which reflect out of hours arrangements;

vii. lone working in the mortuary;
viii. viewing of bodies, including those in long-term storage, by family members and others such as the police;

ix. transfer of bodies internally, for example, for MRI scanning;

x. transfer of bodies and tissue (including blocks and slides) off site or to other establishments;

xi. movement of multiple bodies from the mortuary to other premises, for example, in the event that capacity is reached;

xii. disposal of tissue (including blocks and slides), which ensures disposal in line with the wishes of the deceased person’s family;

xiii. access to the mortuary by non-mortuary staff, contractors and visitors;

xiv. contingency storage arrangements.

**Guidance**

SOPs should reflect guidance contained in the HSE’s document: Managing the risks of infection in the mortuary, post mortem room, funeral premises and exhumation.

Individual SOPs for each activity are not required. Some SOPs will cover more than one activity.

b) Procedures on evisceration ensure that this is not undertaken by an APT unless the body has first been examined by the pathologist who has instructed the APT to proceed.

c) Procedures on body storage prevent practices that disregard the dignity of the deceased.

**Guidance**

For example, placing more than one body on a tray, placing bodies unshrouded on trays, or storing bodies in unrefrigerated storage should not take place.

The family’s permission should be obtained for any ‘cosmetic’ adjustments or other invasive procedures prior to release of bodies, for example, sewing the deceased’s mouth to close it or the removal of a pacemaker. It is also good practice to discuss with the family any condition that may cause them distress, for example when viewing or preparing the body for burial, such as oedema, skin slippage of signs of decomposition.

If identification of the body is to take place before a post-mortem examination, if available, a Police Family Liaison or Coroner’s Officer should have a discussion with the family about the injuries and let them know that reconstruction may be required.

However, the Pathologist should see the body without any changes being made, so if there is a need to reconstruct or clean a body before the post-mortem examination, it should be with the agreement of both the Pathologist and the Coroner. In Home Office cases, a viewing cannot normally take place until after the post-mortem examination.

d) Policies and SOPs are reviewed regularly by someone other than the author, ratified and version controlled. Only the latest versions are available for use.
e) There is a system for recording that staff have read and understood the latest versions of these documents.

f) Deviations from documented SOPs are recorded and monitored via scheduled audit activity.

g) All areas where activities are carried out under an HTA licence are incorporated within the establishment's governance framework.

   Guidance

   These areas include maternity wards where storage of fetuses and still born babies takes place, areas where material is stored for research, the Accident and Emergency Department where removal of samples may take place in cases of sudden unexpected death in infancy. There should be an identified Person Designated in areas of the establishment remote from the main premises.

h) Matters relating to HTA-licensed activities are discussed at regular governance meetings involving establishment staff.

   Guidance

   Meeting minutes should be recorded and made available to staff.

---

### GQ2 There is a documented system of audit

a) There is a documented schedule of audits.

   Guidance

   As a minimum, the schedule should include a range of vertical and horizontal audits checking compliance with documented procedures, the completion of records and traceability.

b) Audit findings document who is responsible for follow-up actions and the timeframe for completing these.

   Guidance

   Staff should be made aware of the outcomes of audits and where improvements have been identified.

c) Regular audits are carried out of tissue being stored so that staff are fully aware of what is held and why and to enable timely disposal of tissue where consent has not been given for continued retention.

   Guidance

   Audits of stored tissue should include samples held under the authority of the police, where applicable.
GQ3 Staff are appropriately qualified and trained in techniques relevant to their work and demonstrate competence in key tasks

<table>
<thead>
<tr>
<th>a)</th>
<th>All staff who are involved in mortuary duties are appropriately trained/qualified or supervised.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Guidance</strong></td>
<td>This includes portering staff, who have responsibility for bringing bodies to the mortuary out of hours and who may not be aware of the potential risks to the deceased during transfer into refrigerated storage, and unqualified mortuary ‘assistant’ staff. APTs should be trained in reconstruction techniques to ensure that the appearance of the deceased is as natural as possible. APTs should be encouraged to work towards the achievement of the RSPH Level 3 Diploma in Anatomical Pathology Technology.</td>
</tr>
<tr>
<td>b)</td>
<td>There are clear reporting lines and accountability.</td>
</tr>
<tr>
<td>c)</td>
<td>Staff are assessed as competent for the tasks they perform.</td>
</tr>
<tr>
<td><strong>Guidance</strong></td>
<td>Assessment of competence should include the standard of APTs’ reconstruction work.</td>
</tr>
<tr>
<td>d)</td>
<td>Staff have annual appraisals and personal development plans.</td>
</tr>
<tr>
<td>e)</td>
<td>Staff are given opportunities to attend training courses, either internally or externally.</td>
</tr>
<tr>
<td><strong>Guidance: attendance by staff at training events should be recorded.</strong></td>
<td></td>
</tr>
<tr>
<td>f)</td>
<td>There is a documented induction and training programme for new mortuary staff.</td>
</tr>
<tr>
<td>g)</td>
<td>Visiting / external staff are appropriately trained and receive an induction which includes the establishment’s policies and procedures.</td>
</tr>
<tr>
<td><strong>Guidance</strong></td>
<td>The qualifications of locum staff should be checked prior to them commencing work in the mortuary and their competency to undertake each task should be assessed. Contractors, visiting and temporary staff and funeral service staff bringing bodies out of hours should be required to read relevant standard operating procedures and sign to confirm their understanding.</td>
</tr>
</tbody>
</table>

GQ4 There is a systematic and planned approach to the management of records

| a) | There is a system for managing records which includes which records must be maintained, how they are backed up, where records are kept, how long each type of record is retained and who has access to each type of record. |
| **Guidance** | Records include mortuary registers, PM examination records, tissue retention forms and |
records of transfer and return of organs/tissue sent elsewhere for examination.

b) There are documented SOPs for record management which include how errors in written records should be corrected.

c) Systems ensure data protection, confidentiality and public disclosure (whistle-blowing).

**GQ5 There are systems to ensure that all untoward incidents are investigated promptly**

<table>
<thead>
<tr>
<th>a)</th>
<th>Staff know how to identify and report incidents, including those that must be reported to the HTA.</th>
</tr>
</thead>
</table>
| Guidance | *HTA-reportable incidents must be reported within five days of the date of the incident or date of discovery.*

*Incidents that relate to a failure of hospital staff to carry out end of life care adequately should be reported internally and the incidence of these monitored.*

<table>
<thead>
<tr>
<th>b)</th>
<th>The incident reporting system clearly outlines responsibilities for reporting, investigating and follow up for incidents.</th>
</tr>
</thead>
<tbody>
<tr>
<td>c)</td>
<td>The incident reporting system ensures that follow up actions are identified (i.e. corrective and preventative actions) and completed.</td>
</tr>
<tr>
<td>d)</td>
<td>Information about incidents is shared with all staff to avoid repeat errors.</td>
</tr>
<tr>
<td>e)</td>
<td>The establishment adopts a policy of candour when dealing with serious incidents.</td>
</tr>
</tbody>
</table>

**GQ6 Risk assessments of the establishment’s practices and processes are completed regularly, recorded and monitored**

<table>
<thead>
<tr>
<th>a)</th>
<th>All procedures related to the licensed activities (as outlined in standard GQ1) are risk assessed on a regular basis.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Guidance</td>
<td><em>Risks to the dignity and integrity of bodies and stored tissue should be covered. The HTA’s reportable incident categories provide a good basis for risk assessments. Risk assessments should be reviewed at regular intervals, for example every 1-3 years or when circumstances change. Staff should be involved in the risk assessment process.</em></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>b)</th>
<th>Risk assessments include how to mitigate the identified risks. This includes actions that need to be taken, who is responsible for each action, deadlines for completing actions and confirmation that actions have been completed.</th>
</tr>
</thead>
</table>
| Guidance | *Relevant staff should have knowledge of risks and the control measures that have been taken*
to mitigate them.

c) Significant risks, for example to the establishment’s ability to deliver post-mortem services, are incorporated into the Trust’s organisational risk register.

---

**Traceability**

**T1 A coding and records system facilitates traceability of bodies and human tissue, ensuring a robust audit trail**

a) Bodies are tagged/labelled upon arrival at the mortuary.

*Guidance*

*The condition and labelling of bodies received in body bags should always be checked and their identity confirmed. They should be labelled on the wrist and/or toe. Body bags should not be labelled in place of the body.*

b) There is a system to track each body from admission to the mortuary to release for burial or cremation (for example mortuary register, patient file, transport records).

*Guidance*

*Body receipt and release details should be logged in the mortuary register, including the date and name of the person who received/released the body and, in the case of release, to whom it was released. This includes bodies sent to another establishment for PM examination or bodies which are sent off site for short-term storage which are subsequently returned before release to funeral service staff.*

c) Three identifiers are used to identify bodies and tissue, (for example post mortem number, name, date of birth/death), including at least one unique identifier.

*Guidance*

*Identification details should not be written on bodies. Where bodies are moved off site for contingency storage the DI should ensure that suitable systems are in place to identify same or similar names.*

d) There is system for flagging up same or similar names of the deceased.

e) Identity checks take place each time a body is moved whether inside the mortuary or from the mortuary to other premises.

*Guidance*

*Mortuary white boards containing the names of the deceased give potential for error if wiped clean (such as when visitors attend for reasons of confidentiality), and should not be relied upon as the sole source of information about the locations of bodies.*

*Fridge/freezer failures that require bodies to be moved temporarily whilst repairs take place*
present a risk to traceability. Full identification checks should be made when they are placed back into normal storage.

f) There are procedures for releasing a body that has been in long term storage and is therefore not in the current register.

g) Organs or tissue taken during post-mortem examination are fully traceable, including blocks and slides (including police holdings). The traceability system ensures that the following details are recorded:
   i. material sent for analysis on or off-site, including confirmation of arrival
   ii. receipt upon return to the laboratory or mortuary
   iii. the number of blocks and slides made
   iv. repatriation with the body
   v. return for burial or cremation
   vi. disposal or retention for future use.

Guidance

Consent information which covers retention/disposal of tissues should be made available to the other site, as appropriate.

h) There are documented procedures for transportation of bodies and tissue anywhere outside the mortuary, (such as to the lab or another establishment), including record-keeping requirements.

Guidance

Formal written agreements with funeral services are recommended. Coroners usually have their own agreements for transportation of bodies and tissue; however, documentation for traceability purposes must still be maintained by the establishment for these cases.

T2 Disposal of tissue is carried out in an appropriate manner and in line with the HTA’s codes of practice.

a) Tissue is disposed of as soon as reasonably possible once it is no longer needed, such as when the coroner’s or police authority over its retention ends or the consented post-mortem examination process is complete.

b) There are effective systems for communicating with the Coroner’s Office, which ensure tissue is not kept for longer than necessary.

c) Disposal is in line with the wishes of the deceased’s family.

Guidance

Organs and tissue returned to the body prior to its release should be contained in clear viscera bags, which prevent leakage, are biodegradable and pose no issues for crematoria in relation to emissions and pollution. Clinical waste bags or household bin bags should not be used for
Tissue blocks and glass slides should not be placed inside the body for the purpose of reuniting tissues with the deceased. Blocks and slides should be placed in a suitable container and transported with the body should the family wish to delay the funeral until the slides are returned.

d) The method and date of disposal are recorded.

### Premises, facilities and equipment

**PFE1 The premises are secure and well maintained and safeguard the dignity of the deceased and the integrity of human tissue**

| a) The premises are clean and well maintained. |
| Guidance |
| *Floors, walls and work surfaces should be of non-porous construction and free of cracks and chips. The premises should be subject to a programme of planned preventative maintenance, which ensures that the premises, facilities and equipment remain fit for purpose.* |
| b) There is demarcation of clear, dirty and transitional areas of the mortuary, which is observed by staff and visitors. |
| c) There are documented cleaning and decontamination procedures and a schedule of cleaning. |
| d) The premises are secure (for example there is controlled access to the body storage area(s) and PM room and the use of CCTV to monitor access). |
| Guidance |
| *Relatives who visit for a viewing should not be able to access the body store area. Security systems and lone working arrangements should take into account viewings which take place out of hours.* |
| e) Security arrangements protect against unauthorized access and ensure oversight of visitors and contractors who have a legitimate right of access. |

**PFE2 There are appropriate facilities for the storage of bodies and human tissue**

| a) Storage arrangements ensure the dignity of the deceased. |
| Guidance |
| *Refrigeration of bodies should be at a temperature of approximately 4 degrees Celsius. The optimal operating temperature for freezer storage is around \(-20\) Celsius, +/- 4 degrees.* |
b) There is sufficient capacity for storage of bodies, organs and tissue samples, which takes into account predicated peaks of activity.

   *Guidance*

   *Capacity should be regularly reviewed, particularly if contingency arrangements are used for an extended period.*

c) Storage for long-term storage of bodies and bariatric bodies is sufficient to meet needs.

   *Guidance*

   *There should be sufficient frozen storage for the long-term storage of bodies; the HTA advises that bodies should be moved into frozen storage after 30-days in refrigerated storage if there is no indication they are soon to be released or further examined, or before, depending on the condition of the body. Where there is insufficient freezer storage to meet needs, there should be arrangements with other establishments, or other contingency steps, to ensure that bodies can be stored appropriately.*

   *Bodies in long-term storage should be checked regularly; this should include confirmation of their identity and the reason for their continued storage.*

   *Where new fridges are installed, these should measure 24”-26” in width and consideration should be given to the proportion that should be larger to accommodate bariatric bodies.*

d) Fridge and freezer units are in good working condition and well maintained.

e) Fridge and freezer units are alarmed and the alarms are tested regularly to ensure that they trigger when temperatures go out of upper or lower set range.

f) Temperatures of fridges and freezers are monitored on a regular basis.

   *Guidance*

   *Temperature monitoring should enable the establishment to identify trends and may mitigate the risk of a possible fridge failure.*

g) Bodies are shrouded or in body bags whilst in storage.

h) There is separate storage for infants and babies. If not, special measures are taken for the bodies of infants and babies.

i) There are documented contingency plans in place should there be a power failure or insufficient numbers of refrigerated storage spaces during peak periods.

   *Guidance*

   *Where contingency arrangements involve the transfer of bodies to other premises, these should be assessed to ensure that they are suitable and that traceability systems are of the required standard. Stacking bodies on the same fridge tray is not considered suitable practice.*

   *Establishments should have documented agreements with any funeral services that they may use for contingency storage. Consideration should be given to whether the funeral service provides contingency storage for other mortuaries. SOPs should address issues such as risk*
assessments and same/similar name systems.

The hire of temporary storage units should not be the sole contingency arrangement for an establishment. Establishments should put in place other formally agreed arrangements for contingency storage. Where the hire of temporary storage facilities forms part of establishments’ contingency arrangements, consideration should be given well in advance and steps taken to ensure availability of funds, and of units for hire.

Establishments should consider entering into Mutual Aid Agreements with neighbouring organisations in order that they can provide and obtain support during periods of capacity shortages.

| PFE3 Equipment is appropriate for use, maintained, validated and where appropriate monitored |
|---|---|
| a) | Items of equipment in the mortuary are in a good condition and appropriate for use: |
|   | i. fridges / freezers |
|   | ii. hydraulic trolleys |
|   | iii. post mortem tables |
|   | iv. hoists |
|   | v. saws (manual and/or oscillating) |
| Guidance | Equipment should be made of material that is easy to clean, impervious, non-rusting, non-decaying and non-staining. |
| b) | Equipment is appropriate for the management of bariatric bodies. |
| c) | The ventilation system provides the necessary ten air changes per hour and is checked and maintained at least annually. |
| Guidance | COSHH requires a thorough examination of the ventilation system at 14-month intervals, and sets out what the examination should cover. |
| d) | Staff have access to necessary PPE. |
| Guidance | Where face masks should be worn, they should be face fitted. |
| e) | Where chemicals are used for preservation of tissue samples, there is adequate ventilation. |
| f) | Key items of equipment, including fridges/freezers, trolleys and post mortem tables (if downdraught) are subject to regular maintenance and records are kept. |
Guidance

This includes fridges in Maternity where fetuses or still born babies are stored prior to examination. Maintenance records may be held by the mortuary or centrally by the Trust, such as the Estates Department. They should be available for review during inspection by the HTA.
Appendix 2: Classification of the level of shortfall

Where the HTA determines that a licensing standard is not met, the improvements required will be stated and the level of the shortfall will be classified as ‘Critical’, ‘Major’ or ‘Minor’. Where the HTA is not presented with evidence that an establishment meets the requirements of an expected standard, it works on the premise that a lack of evidence indicates a shortfall.

The action an establishment will be required to make following the identification of a shortfall is based on the HTA’s assessment of risk of harm and/or a breach of the HT Act or associated Directions.

1. Critical shortfall:

A shortfall which poses a significant risk to human safety and/or dignity or is a breach of the Human Tissue Act 2004 (HT Act) or associated Directions
or
A combination of several major shortfalls, none of which is critical on its own, but which together could constitute a critical shortfall and should be explained and reported as such.

A critical shortfall may result in one or more of the following:

(1) A notice of proposal being issued to revoke the licence
(2) Some or all of the licensable activity at the establishment ceasing with immediate effect until a corrective action plan is developed, agreed by the HTA and implemented.
(3) A notice of suspension of licensable activities
(4) Additional conditions being proposed
(5) Directions being issued requiring specific action to be taken straightaway

2. Major shortfall:

A non-critical shortfall that:
- poses a risk to human safety and/or dignity, or
- indicates a failure to carry out satisfactory procedures, or
- indicates a breach of the relevant CoPs, the HT Act and other relevant professional and statutory guidelines, or
- has the potential to become a critical shortfall unless addressed
or
A combination of several minor shortfalls, none of which is major on its own, but which, together, could constitute a major shortfall and should be explained and reported as such.

In response to a major shortfall, an establishment is expected to implement corrective and preventative actions within 1-2 months of the issue of the final inspection report. Major shortfalls pose a higher level of risk and therefore a shorter deadline is given, compared to minor shortfalls, to ensure the level of risk is reduced in an appropriate timeframe.

3. Minor shortfall:

A shortfall which cannot be classified as either critical or major, but which indicates a
departure from expected standards.

This category of shortfall requires the development of a corrective action plan, the results of which will usually be assessed by the HTA either by desk based or site visit.

In response to a minor shortfall, an establishment is expected to implement corrective and preventative actions within 3-4 months of the issue of the final inspection report.

Follow up actions

A template corrective and preventative action plan will be sent as a separate Word document with both the draft and final inspection report. You must complete this template and return it to the HTA within 14 days of the issue of the final report.

Based on the level of the shortfall, the HTA will consider the most suitable type of follow-up of the completion of the corrective and preventative action plan. This may include a combination of

- a follow-up site-visit inspection
- a request for information that shows completion of actions
- monitoring of the action plan completion
- follow up at next desk-based or site-visit inspection.

After an assessment of your proposed action plan you will be notified of the follow-up approach the HTA will take.
